GO·LINE

Celegon is expanding its product line for doors and furnishings with the introduction of a new collection of door handles featuring a mechanism integrated into the door panel, characterized by clean, minimalist lines.

This design approach aims to combine the traditional handle and lock into a single element that enhances both the functionality and the overall design of the door.

GO·LINE handles guarantee the same high-quality materials, functional reliability, and attention to aesthetics that set all CELEGON products apart.
The system is ideal for residential applications, hospitality facilities, and public spaces, as well as for high-traffic environments.

Its long-term reliability, requiring no maintenance, stems from careful design, the use of selected materials, and a production process that is entirely Made in Italy, backed by over seventy years of experience.

1.

SEAMLESS INTEGRATION INTO THE DOOR

The hidden mechanism, easy to install, eliminates the perception of the hardware as an applied element, allowing for clean, uncluttered surfaces.

2.

AESTHETIC CONTINUITY AND DESIGN FREEDOM

The lock face on the side of the door and its corresponding fitting in the door jamb disappear, bringing the purity of the materials, finishes, and geometries to the forefront.

3.

NO HANDLE PROTRUSION

GO·LINE is versatile and can be installed on hinged doors—including flush-mounted ones—sliding doors, folding doors, Compack® systems, and rotary-sliding doors, whether single or multiple panels, including Ergon® Folding systems.

4.

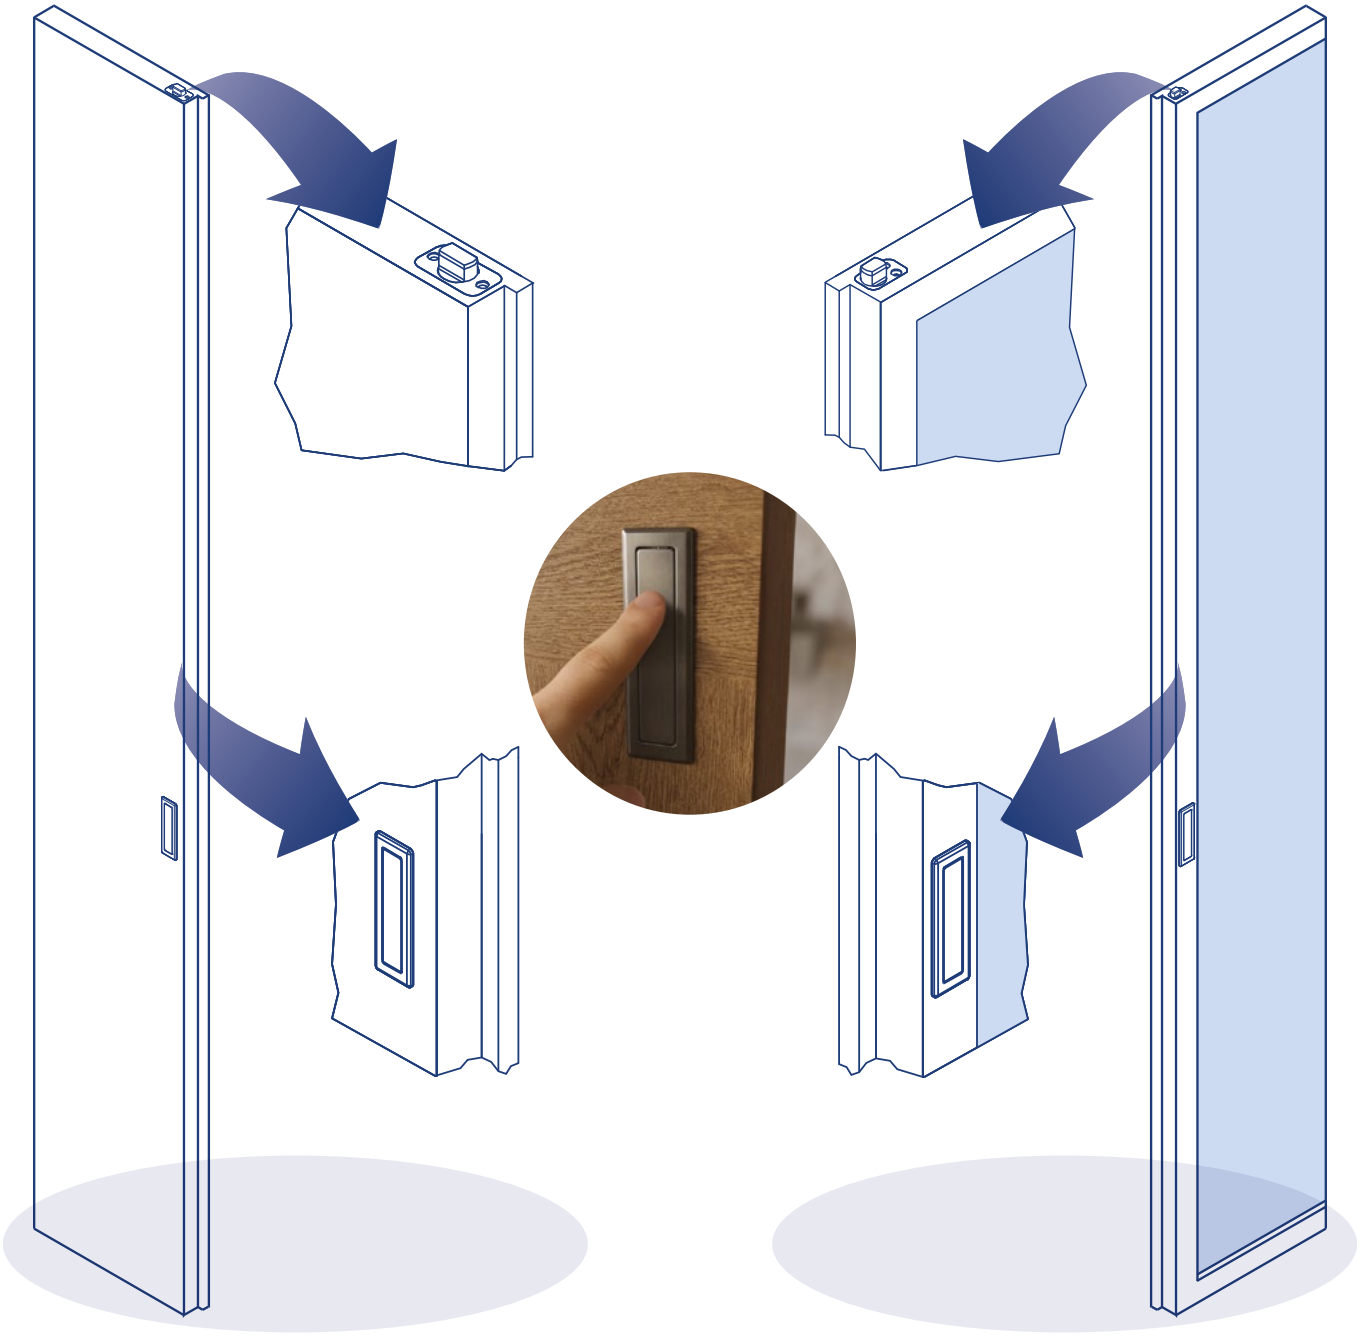

DISCREET TECHNOLOGY, AND INTUITIVE USE

The minimalist design combines everyday comfort with smooth opening movement, blending naturally into the architecture.

GO·LINE

Up&Go

When the recessed lever is lifted, the magnetic latch disengages from the strike plate integrated into the top crossbar, allowing the door to open.
The door panel and side jamb are completely free of visible hardware and components, highlighting the clean lines of the surfaces.
In the double-door configuration, each door is equipped with its own magnetic locking system integrated into the upper section.
This independent mechanism allows each door to be opened individually, offering maximum freedom of use.

GO·LINE

Push&Go

Push&Go reimagines the concept of locking a semi-fixed door panel, replacing traditional lever latches with a discreet, intuitive, and ergonomic solution. The mechanism, positioned at a natural height for use, allows the door to open instantly with a simple press, while closing is performed by the magnetic latch, which engages automatically without requiring any further action. The same design philosophy extends to sliding doors, where a special configuration of the magnetic latch—oriented at 90° and paired with a dedicated stop in the track—allows the door to be locked in the open position.
